

Wei-Sen “Mark” Hung

Backend Software Engineer — Java — Spring Boot — Distributed Systems

+886 932 676 305 — 1909kram@gmail.com — linkedin.com/in/markhung384 — github.com/MarkHungBuddha

Professional Experience

Software Engineer

February 2025 – April 2026

Momo, Taiwan's Major E-commerce Platform

Taipei, Taiwan

- Owned the order-qualification system end-to-end — scoped the requirements, committed a delivery timeline, and after concluding the legacy batch system was no longer maintainable, led a ground-up rebuild as a brand-new event-driven system. Shipped a **Kafka + MongoDB** pipeline with **Prometheus/Grafana** observability to production, cutting calculation latency from 3–5 minutes to an average of **4 seconds**; used AI-assisted development (Claude Code) to accelerate implementation and testing.
- Diagnosed and pinpointed the root-cause bottleneck slowing API response time, then led the optimization — choosing Redis caching alongside critical-path tuning to cut campaign API response time from 1000ms+ to **under 100ms**.
- Served as the central point of coordination between business users and the engineering team across Double 11 and daily campaigns (**100,000+ daily active users**): drove requirements discovery, confirmed and locked specs, and defined acceptance checkpoints with both sides. In parallel, used AI-assisted development to refactor long-standing **Vue.js/jQuery** frontend tech debt.
- Proactively initiated and rolled out **Scrum** in a team that had no established process: introduced workload metrics and progress visibility so leads and members could track load and status, making delivery more predictable (sharper estimates, fewer slips) and substantially cutting ad-hoc interruptions and coordination back-and-forth.

Java Software Engineer

December 2023 – November 2024

Business Intelligence Info. Corp, Banking Systems

Taipei, Taiwan

- Moved Personally Identifiable Information (PII) masking from frontend to backend using Interceptors and Spring Cache, lowering API latency from **1000ms to 60ms** and improving load-test throughput by **30%**.
- Refactored the Role-Based Access Control (RBAC) permission model from User/Role to Organization/User/Role for more granular scope control.
- Implemented AOP-based audit logging of SQL statements and API paths to support regulatory compliance and access traceability.

Side Projects

TravelCal – Sports Travel Calendar Platform

Personal Project — Go, PostgreSQL/PostGIS, React, TypeScript, Docker, GitHub Actions

- Designed and deployed a full-stack sports-event discovery platform with geospatial radius search, date-range filtering, and multilingual (zh-TW/EN/JA) data; Go + Chi REST API backed by PostgreSQL/PostGIS with GIST indexes and JSONB metadata.
- Built a React + TypeScript frontend (FullCalendar, Leaflet/OpenStreetMap, i18next) over a Python/Playwright scraping pipeline covering **2,900+ events** across NPB, CPBL, J.League, B.League, and more.
- Containerized with Docker Compose and automated deployment via GitHub Actions, GHCR, and Caddy.

Life Simulation Game – Monte Carlo Retirement Simulator

Personal Project — TypeScript, React, Zustand, Web Worker, Vitest

- Engineered a browser-based Monte Carlo engine running **10,000 simulation paths** with deterministic seeded randomness for retirement and life-planning scenarios.
- Modeled sequence risk and fat-tail behavior via Block Bootstrap resampling of historical returns instead of normal-distribution assumptions; offloaded computation to a Web Worker to keep the UI responsive.
- Added Vitest regression tests covering financial calculation rules and simulation behavior.

Education

B.S. in Computer Science & Information Engineering

September 2018 – June 2022

Tamkang University

New Taipei City, Taiwan

Technical Skills & Languages

Languages	Java, Go, TypeScript, SQL, Python
Frameworks	Spring Boot, React, Vue.js
Databases & Messaging	MongoDB, PostgreSQL/PostGIS, Redis, Kafka
Infrastructure & Tools	Docker, Kubernetes, AWS, GitHub Actions (CI/CD), K6, Prometheus, Grafana
AI-Assisted Development	Claude Code, Codex, opencode — applied across spec, development, testing, and review
Engineering Focus	Distributed Systems, Event-Driven Design, Performance Optimization, RBAC Security, Root Cause Analysis
Spoken Languages	Mandarin Chinese (Native), English (Professional Working Proficiency)
